## Method Overriding

- by Harsha Vardhan

### Method Overriding

- It is a concept, which is used to extend the parent class's method, by creating another method in the child class with same name and same parameters.
- The parent class's method invoked using "base" keyword.
- When method overriding is done, the parent class's method first and child's method executed next.
- Method Overriding is done with "virtual" keyword at parent class; and "override" keyword at child class's method.

#### Creating Parent Class

```
class ParentClassName
{
    public virtual void MethodName( param1, ... )
    {
    }
}
```

#### Creating Child Class

```
class ChildClassName : ParentClassName
{
    public override void MethodName( param1, ... )
    {
    }
}
```
