Static Constructors

- by Harsha Vardhan

What is Static Constructor

- Static Constructors are mainly used to initialize the static fields and also perform initialization logic, when the first object is created for the class.
- Static Constructor gets executed automatically, when the class name is used for the first time, while execution [from Main method].
- Static Constructor is "public" by default.
- Static Constructor can't have parameters; can't return any value.

Static Constructor

```
static ClassName()  
{  
    ...  
}
```
