Default Arguments

- by Harsha Vardhan

What is Default Argument?

- When you set “default value” for the “parameter of a method”, it is called “default argument”.
- If you pass argument value for the parameter, then the supplied value will be assigned into the parameter; if you don’t pass argument value for the parameter, then the default argument value gets automatically assigned into the parameter.
- Thus, the parameter becomes as “optional parameter”. That means, it is optional pass value into that parameter.

Syntax:

```
AccessModifier Modifier ReturnDataType MethodName(Parameter = DefaultArgument)
{
}
```
