"this" keyword

- by Harsha Vardhan

What is "this" keyword

- The "this" keyword refers to "current object", which method has invoked the method.
- The "this" keyword is available only within the "non-static methods".
- "this" keyword can be used to access fields or methods of current object, inside the class.
- "this" keyword usage is by default optional. But if the "name of local variable" and "name of field" are same, "this.field" accesses the field; "localVariable" accesses the local variable.
