Readonly Fields

- by Harsha Vardhan

What is Readonly Field

- Readonly Fields are the Fields that are stored in each object [much like normal fields].
- Readonly Fields are accessible with reference variable [with object].
- We can't change the value of readonly field.
- Readonly Fields must be initialized, either "in-line with declaration" [or] "in the constructor".

Readonly Field Declaration Syntax

```
AccessModifier  readonly  DataType  FieldName = value;
```
