Method Hiding

- by Harsha Vardhan

Method Hiding

- It is a concept, which is used to hide (overwrite) the parent class's method, by creating another method in the child class with same name and same parameters.
- When method hiding is done, the child class's method only executes; parent class's method will not be executed.
- Method hiding is done automatically [or] with "new" keyword.

Creating Parent Class

```
class ParentClassName
{
    public void MethodName( param1, … )
    {
    }
}
```

Creating Child Class

```
class ChildClassName : ParentClassName
{
    public new void MethodName( param1, … )
    {
    }
}
```
