The System.Object Class

- by Harsha Vardhan

System.Object Class

- The "System.Object" is a pre-defined class, which is the "Ultimate super class" in .net.
- All the classes and other types are inherited from System.Object directly / indirectly.
- The System.Object class provides the following methods, that can be used in any class or other types:
    - bool Equals(object value)
    - int GetHashCode( )
    - Type GetType( )
    - string ToString( )

System.Object Class [Pre-defined]

```
namespace System
{
    class Object
    {
    }
}
```

class System.Object

class System.ValueType
